

CLAIMS

1. A method of dynamically creating a list of operating systems for a target
5 device in communication with a server prior to executing an operating system on the
target device, comprising:

receiving from the server, at the target device, an available operating
systems list of at least one operating system available to the target device;

determining a hardware configuration of the target device;

10 determining if the hardware configuration is compatible with each
operating system from the available operating systems list; and

generating a compatible operating systems list.

2. The method of claim 1 wherein the hardware configuration is determined
15 by a network discovery process.

3. The method of claim 1, further comprising:
mapping a specific location of the target device.

20 4. The method of claim 3 further comprising:
determining at least one location-based operating system that is based on
the specific location of the target device.

5. The method of claim 4 further comprising:
25 determining if the hardware configuration is compatible with the location-
based operating system.

6. The method of claim 4 wherein the compatible operating systems list does not include the location-based operating system, further comprising:

adding the location-based operating system to the compatible operating systems list.

5

7. The method of claim 4, wherein the available operating systems list does not include the location-based operating system, further comprising:

adding the location-based operating system to the available operating systems list.

10

8. The method of claim 1, further comprising:
selecting, at the target device, a target operating system from the compatible operating system list.

15

9. The method of claim 8 further comprising:
receiving at the target device, the target operating system.

20

10. The method of claim 9 further comprising:
providing an initial bootstrap to the target device; and
executing the initial bootstrap on the target device before the target operating system is selected.

25

11. The method of claim 10 further comprising:
relocating the initial bootstrap after the target operating system is received.

12. Computer program product in a computer usable medium for dynamically creating a list of operating systems for a target device in communication with a server, comprising:

means for receiving at the target device an available operating systems

5 list of at least one operating system available to the target device;

means for determining a hardware configuration of the target device;

means for determining if the hardware configuration is compatible with each operating system from the available operating systems list; and

means for generating a compatible operating systems list.

10

13. The program of claim 12 further comprising:

means for discovering the hardware configuration via a network discovery process.

15

14. The program of claim 12 further comprising:

means for determining at least one location-based operating system based on the location of the target device.

20

15. The program of claim 14 further comprising:

means for adding the location-based operating system to the available operating systems list.

25

16. The program of claim 14 further comprising:

means for determining if the hardware configuration is compatible with the location-based operating system.

17. The program of claim 16 further comprising:
means for adding the location-based operating system to the compatible operating systems list if the hardware configuration is compatible with the location-based operating system.

5

18. The program of claim 12, further comprising:
means for receiving a selection of a target operating system from the compatible operating system list; and
means for sending the target operating system to the target device.

10

19. The program of claim 18 further comprising:
means for executing a network bootstrap on the target device before the target operating system is selected.

15

20. The method of claim 19 further comprising:
means for relocating the network bootstrap after the target operating system is selected.

20

21. A network data processing system comprising:
means for sending an available operating systems list from a server to a target device prior to executing an operating system on the target device;
means for determining a hardware configuration of the target device;
means for determining if the hardware configuration is compatible with each operating system from the available operating systems list; and
means for generating a compatible operating systems list.

25

22. The system of claim 21 further comprising:
means for determining a specific location of the target device;
means for determining at least one location-based operating system that
is based on the specific location; and
5 means for determining if the location-based operating system is
compatible with the hardware configuration.

23. The system of claim 21 further comprising:
means for executing a network bootstrap program on the target device
10 before a target operating system is selected;
means for selecting the target operating system from the compatible
operating systems list;
means for relocating the network bootstrap program after the target
operating system is selected; and
15 means for sending the target operating system to the target device.
